RUST PROGRAMMING

Presentation by

Surendra Varma Pericherla

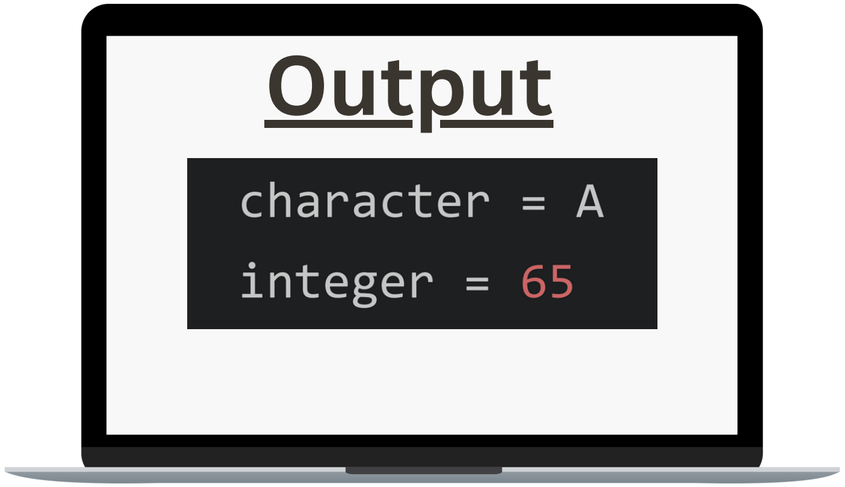
Rust Type Casting

Type casting allows us to convert variables of one data type to another.

Example

```
// create a floating-point variable
let decimal: f64 = 9.6321;

// convert floating point type to integer type
let integer = decimal as u16;
```

Type Conversion: Character to Integer in Rust


```rust
fn main() {
    let character: char = 'A';

    // convert char type to u8 integer type
    let integer = char as u8;

    println!("character = {}", character);
    println!("integer = {}", integer);
}
```
