RUST PROGRAMMING

Presentation by

Surendra Varma Pericherla

Rust Variables

we use variables to store data

Example

let x = 1;

Here, x is the name of the variable which stores the value.

Example

```rust
fn main() {
    let age = 31;
    println!("Age: {}", age);
    let name = "John";
    println!("Name: {}", name);
}
```

Changing Rust Variables

Default : immutable

Example

```rust
fn main() {
    // declare a variable with value 1
    let x = 1;
    println!("x = {}", x);

    // change the value of variable x
    x = 2;
    println!("x = {}", x);
}
```

Mutability in Rust

```
let mut x = 1;
```

Example

```rust
fn main() {
    // declare a mutable variable with value 1
    let mut x = 1;
    println!("Value of x = {}", x);

    // change the value of variable x
    x = 2;
    println!("Updated value of x = {}", x);
}
```

```
Value of x = 1
Updated value of x = 2
```
